

APPLICATION OVERVIEW

O&M Centralized Document — Share Drive

A secure, centralized document management platform for Operations & Maintenance teams

O&M Centralized Document – Share Drive is a proprietary web-based application developed under **Seatrium** to serve as a centralized, secure document repository for Operations & Maintenance (O&M) teams. Functioning similarly to a cloud drive (e.g. Google Drive), it enables users to create structured directories, upload and manage files, and control access — both within the organization and with external parties — from a single, unified interface integrated into the O&M portal ecosystem.

Confidentiality Notice: This document serves as an application preview substitute for the *O&M Centralized Document – Share Drive* system. The full application and its source code remain the intellectual property of Seatrium and are not disclosed herein. Screenshots are used solely for portfolio demonstration purposes.

Core Features & Capabilities

The application delivers a full-featured document management experience designed around the daily needs of O&M teams.

Directory Management

Create, rename, and delete directories. Nested sub-directories allow flexible hierarchical organization of all project documents.

File Upload & Download

Upload any file type into user-owned directories. Bulk download as ZIP is supported. Files are securely stored by the system backend.

Sharing Controls

Share files or directories with registered users or generate external access links for non-registered parties with configurable permissions.

Access Locking

Directories and files can be locked by their owner, restricting visibility and modification to authorized users only.

Audit Trail

Created and updated timestamps are tracked for every directory and file, supporting accountability and change history visibility.

Search & Pagination

Real-time search within directories and configurable entries-per-page make navigation efficient even with large numbers of files.

Directory Drill-down View

Clicking into any directory reveals its sub-directories and files. The breadcrumb navigation allows users to trace their path back through the folder hierarchy.
